## Amendments to the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application:

## Listing of Claims

- 1-15. (cancelled)
- 16. (previously presented) An intravascular catheter comprising an elongate shaft having a reinforcement layer comprising a tubular braid having a first helical member interwoven with a second helical member and a plurality of axial members disposed between the first helical member and the second helical member for the entire length of the axial member.
- 17. (original) An intravascular catheter as in claim 16, wherein the axial members are uniformly spaced about the circumference of the shaft.
- 18. (original) An intravascular catheter as in claim 17, wherein four axial members are uniformly spaced apart by 90° about the circumference of the shaft.
- 19. (original) An intravascular catheter as in claim 17, wherein eight axial members are uniformly spaced apart by 45° about the circumference of the shaft.
- 20. (original) An intravascular catheter as in claim 16, wherein the elongate shaft includes a proximal portion and a distal portion, and wherein the distal shaft portion has fewer axial members than the proximal shaft portion.
  - 21. (cancelled)
- (original) An intravascular catheter as in claim 16, wherein the first and second helical members each comprise polymeric material.

- 23. (original) An intravascular catheter as in claim 22, wherein the first and second helical members each comprise a plurality of monofilaments.
- 24. (original) An intravascular catheter as in claim 16, wherein the axial members each comprise a polymeric material.
- 25. (original) An intravascular catheter as in claim 24, wherein the axial members each comprise a plurality of polymeric monofilaments.
- 26. (original) An intravascular catheter as in claim 25, wherein the monofilaments are held together statically.
- (original) An intravascular catheter as in claim 26, wherein the monofilaments comprise LCP.
- 28. (original) An intravascular catheter as in claim 27, wherein the monofilaments are arranged side-by-side to collectively define a flat ribbon.
- 29. (previously presented) A method of making a portion of a shaft of an intravascular catheter, the method comprising the steps of:

braiding a first helical member and a second helical member about a carrier such that a plurality of axial members are disposed between the first and second helical members for the entire length of the axial member.

30. (original) A method of making a portion of a shaft of an intravascular catheter as in claim 29, wherein the axial members are uniformly spaced about the circumference of the shaft. Appl. No. 10/774,739 Amdt. AF dated JULY 28, 2008 Reply to Final Office Action of May 28, 2008

31. (original) A method of making a portion of a shaft of an intravascular catheter as in claim 30, wherein four axial members are uniformly spaced apart by 90° about the circumference of the shaft.

32. (original) A method of making a portion of a shaft of an intravascular catheter as in claim 30, wherein eight axial members are uniformly spaced apart by 45° about the circumference of the shaft
